

NAFEMS

# Challenges in the Computational Modeling of Multi-physics Processes and Systems – with a special focus on fluid-structure interaction (FSI)

June 20, 2007

# Agenda

NAFEMS Multi-Physics Webinar

June 20, 2007

12:00pm EST (GMT -05:00, New York)

## **Welcome & Introduction**

 Matthew Ladzinski, NAFEMS North American Representative

## **Challenges in the Computational Modeling of Multi-physics Processes and Systems – with a special focus on fluid-structure interaction (FSI)**

 Dr. Mark Cross, University of Wales, Swansea

 Dr. Avril Slone, University of Wales, Swansea

## **Q&A Session**

## **Closing**

**THE INTERNATIONAL ASSOCIATION  
FOR THE ENGINEERING ANALYSIS  
COMMUNITY**

# An Introduction to NAFEMS

Matthew Ladzinski  
NAFEMS  
North American Representative

## What is NAFEMS?

- NAFEMS is a not-for-profit membership association of nearly **800 companies** from all over the world.
- We are the:
  - International Association for the Engineering Analysis Community
  - Information source for the latest CAE technology developments
  - Source of Best Practice guides for the use of Analysis Technology
  - Provider of independent events where practicing Analysts exchange knowledge and experience
  - Voice of the CAE world

# NAFEMS Objectives

NAFEMS mission is to act as a trusted source and a collaborative resource for the best engineering modeling, simulation and analysis practices in the development of safe, reliable, and affordable products. Its focus is to champion and improve best practices, to promote and enrich educational opportunities aligned with the rapidly-advancing technologies, and to advance the productivity and quality of virtual product development processes.

Specific objectives of NAFEMS are to:

- Promote **COLLABORATION** within the international engineering analysis and simulation community,
- Stimulate **INNOVATION** via transfer of knowledge in the use of advanced scientific, engineering and computing technologies,
- Maximize **PRODUCTIVITY** through improved best practices used in product development engineering processes,
- Implant **QUALITY** in the methods and techniques exploited by virtual product development processes.

# Membership Profile

■ Industrial Users

■ Consultants

■ Academics

■ Software Vendors and Researchers

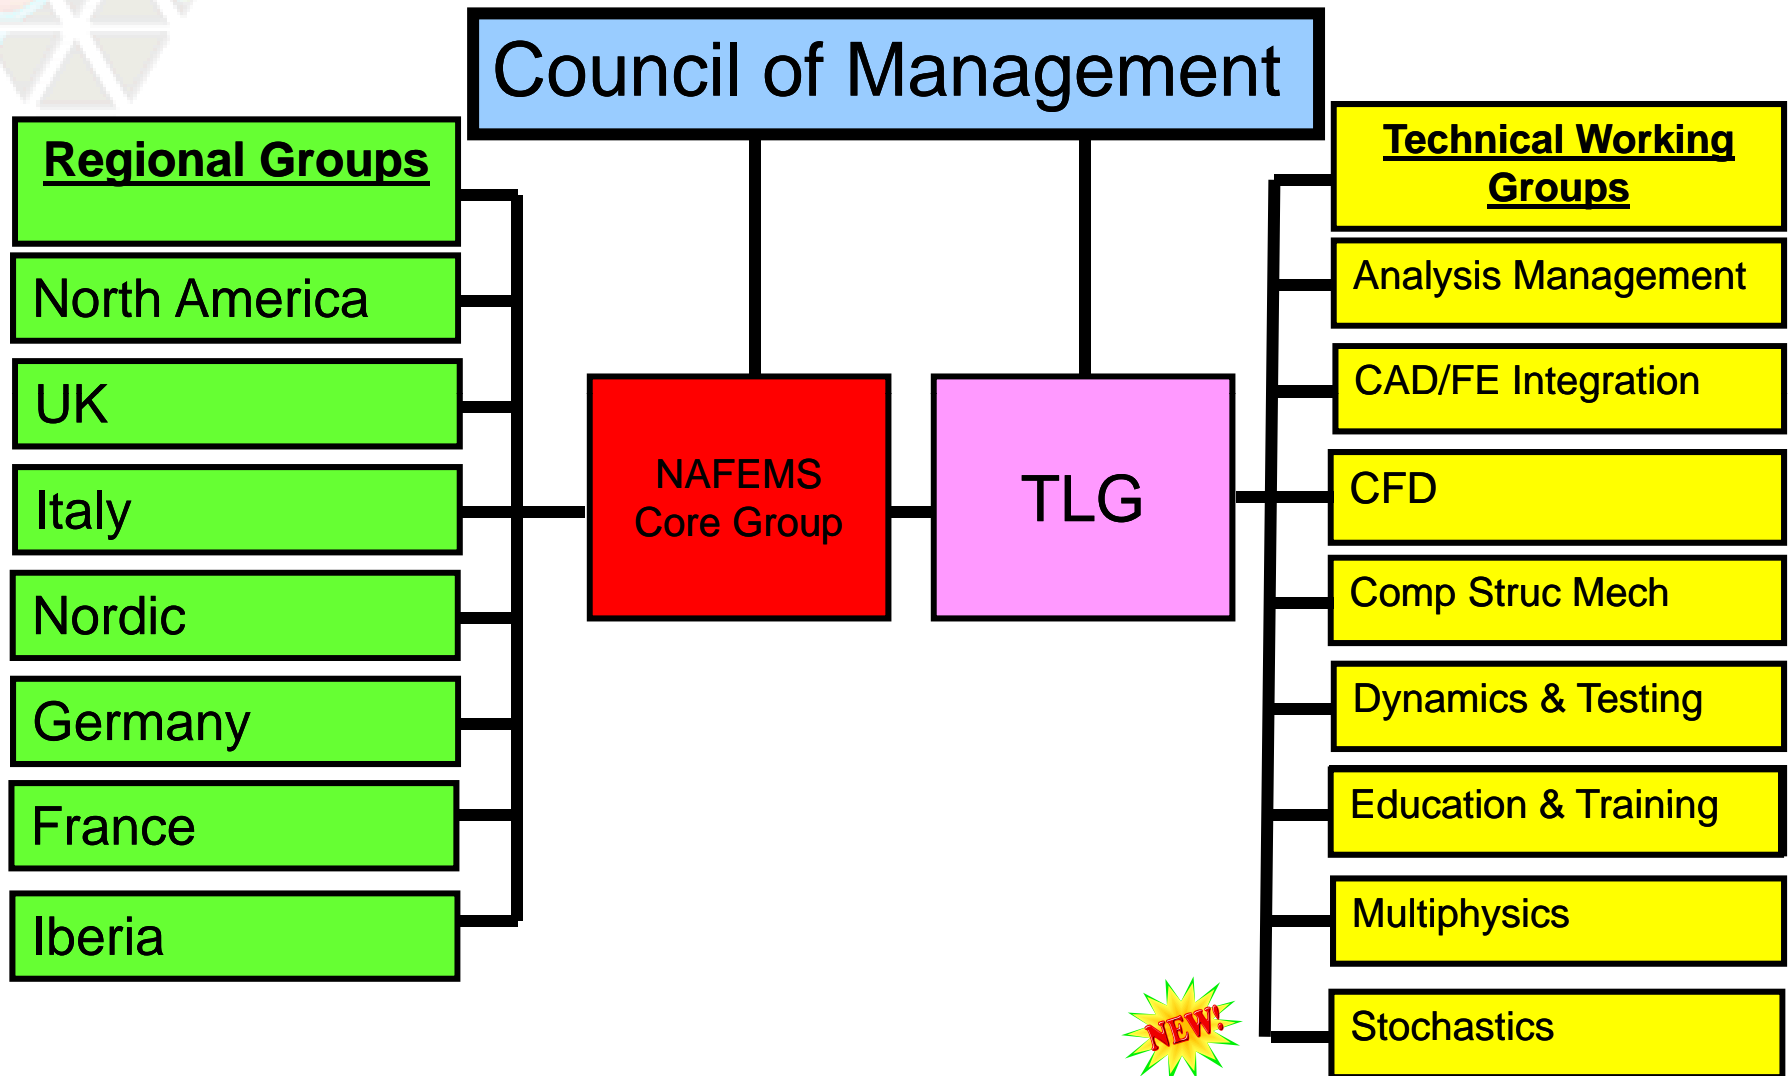

# Membership Profile

- |   |  |
|---|--|
|  Aerospace                   |  Land Transport             |
|  Process and Manufacturing   |  Power and Pressure Systems |
|  Civil & Construction        |  Marine & Offshore          |
|  Consumer Goods & Biomedical |  |

# NAFEMS Organizational Structure

## Technical Working Groups

 These groups produce the NAFEMS documents (guidelines, reports, books etc.). The groups are:

- Education & Training Working Group
- Computational Structural Mechanics Working Group
- CFD Working Group
- CAD/Integration Working Group
- Analysis Management Working Group
- Multiphysics Working Group
- Dynamics and Testing Working Group
- Stochastics Working Group 

# Publications

Library of internationally acclaimed publications developed over the years including:

- ▀ Primers
- ▀ “How to...” Guides
- ▀ “Why do...” Guides
- ▀ Benchmarks

Issued to members as deliverables as they are developed

## Planned Activities in North America

 Planning a significant increase in activities over coming months:

- Work Session on the Management of Simulation Data
  - ***“Take Control of Your Analysis and Simulation Data”***
  - September 27, 2007
  - [www.nafems.org/92707](http://www.nafems.org/92707)
- Webinars
  - **New topic each month!**
    - Process Management, July 2007
  - Recent webinars:
    - NWC07 Preview
    - Simulation-supported Decision Making
    - Simulation Driven Design (SDD) Findings
    - NAFEMS Discovery

For the latest information, please refer to the NAFEMS website:  
[http://www.nafems.org/regional/north\\_america](http://www.nafems.org/regional/north_america)

**THE INTERNATIONAL ASSOCIATION  
FOR THE ENGINEERING ANALYSIS COMMUNITY**

**Thank you!**

# Challenges in the Computational Modeling of Multi-physics Processes and Systems – with a special focus on fluid-structure interaction (FSI)

Mark Cross and Avril K. Slone  
Center for Civil and Computational  
Engineering  
School of Engineering  
University of Wales, Swansea

[m.cross@swan.ac.uk](mailto:m.cross@swan.ac.uk); [a.k.slone@swan.ac.uk](mailto:a.k.slone@swan.ac.uk)

# Why Multi-physics Modelling ?

- Large number of real world problems require multi-physics simulation tools.
- Examples
  - Solidification problems – Solder Joints
  - Fluid-Structure interaction – Flutter in aircraft wings
- Need to solve for integrated physics
- Ensure two-way coupling

NAFEMS Webinar  
June 2007

# Challenge of multi-physics

- **Multi-physics** - closely coupled interactions amongst separate continuum physics phenomena
- CAE analysis software essentially phenomena specific :
  - CFD - FV techniques with segregated iterative solvers
  - CSM - FE techniques with direct solver structure
  - CAA & CEM uses any of FE/FV/BE/FDTD techniques**plus heritage software approaches** that go with each.
- Must ensure **accurate filtering and mapping of data** for volume source and boundary data
- Must ensure that where needed, **the mesh and geometries deform compatibly**

# Directly Coupled Problems

$$\underline{\mathbf{K}}\underline{\mathbf{a}} = \underline{\mathbf{f}}$$

$$\underline{\mathbf{K}} = \begin{bmatrix} \underline{\mathbf{K}}_f & \underline{\mathbf{K}}_{fs} & \underline{\mathbf{K}}_{ft} \\ \underline{\mathbf{K}}_{sf} & \underline{\mathbf{K}}_s & \underline{\mathbf{K}}_{st} \\ \underline{\mathbf{K}}_{tf} & \underline{\mathbf{K}}_{ts} & \underline{\mathbf{K}}_t \end{bmatrix}$$

$$\underline{\mathbf{a}} = \begin{bmatrix} \underline{\mathbf{a}}_f \\ \underline{\mathbf{a}}_s \\ \underline{\mathbf{a}}_t \end{bmatrix}$$

$$\underline{\mathbf{f}} = \begin{bmatrix} \underline{\mathbf{f}}_f \\ \underline{\mathbf{f}}_s \\ \underline{\mathbf{f}}_t \end{bmatrix}$$

A single code for all phenomena  
– coupling direct

# Staggered Solution:

$$\underline{\mathbf{K}}_f^n \underline{\mathbf{a}}_f^n = \underline{\mathbf{f}}_f^n - \underline{\mathbf{g}}_1(\underline{\mathbf{a}}_s^{n-1}, \underline{\mathbf{a}}_t^{n-1})$$

$$\underline{\mathbf{K}}_s^n \underline{\mathbf{a}}_s^n = \underline{\mathbf{f}}_s^n - \underline{\mathbf{g}}_2(\underline{\mathbf{a}}_f^n, \underline{\mathbf{a}}_t^{n-1})$$

$$\underline{\mathbf{K}}_t^n \underline{\mathbf{a}}_t^n = \underline{\mathbf{f}}_t^n - \underline{\mathbf{g}}_3(\underline{\mathbf{a}}_s^n, \underline{\mathbf{a}}_t^n)$$

Impact of using  
distinct solvers  
for each phenomenon

*Explicit or implicit*

# Classifying multi-physics

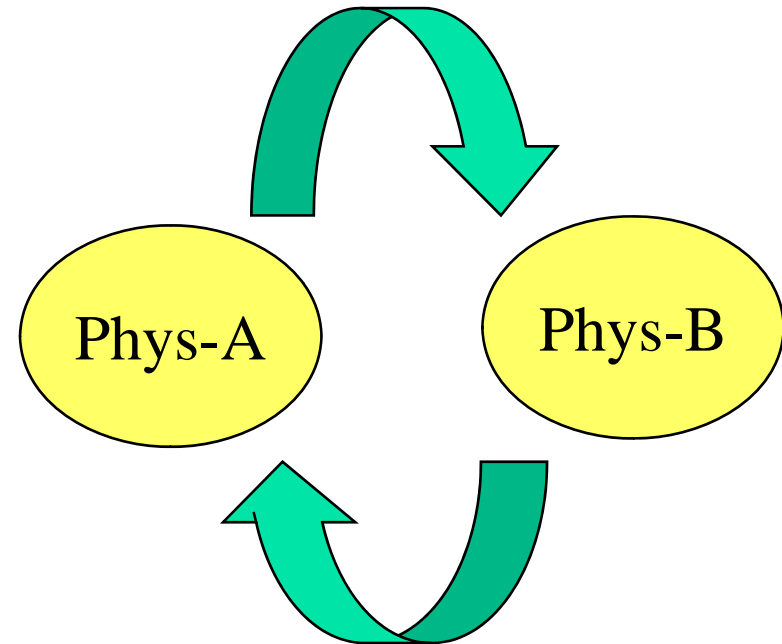

- Most vendors advertise *multi-physics*
- Most vendors offer *multi-disciplinary*
- *Multi-disciplinary* – using data generated by one code as input into another – *loose or one way coupling*  
(e.g. electric field loading a thermal calculation)
- *Multi-physics* – two way exchange of information, which could involve implicit convergence within a time-step  
(e.g. thermo-mechanical)
- *Closely coupled multi-physics* – time and space accurate exchange of data  
(e.g. dynamic fluid-structure interaction)

# Key issues in closely coupled multi-physics simulation

- Interpolation from one set of variables to another => **compatibility of mesh**
- **Virtual single database** of mesh data & simulation variables
- **Solver strategy**
  - direct vs iterative
  - Eulerian vs Lagrangian
- Is coupling strategy compatible with **scalable parallelism**, EVEN if software components are parallel

# Multi-physics: coupling issues

- a) Existing 'component' phenomena analysis software – **coupling**
- b) **Need a filter structure for code interoperability:-** exchange information directly from each others database **without opening closing files**
- c) Options here derive from tools for developed for parallelisation – especially PVM, MPI and **specifically MpCCI**
- d) **Interoperability not equivalent to simulating physics of coupling**
- e) **Remaining Challenge** - parallel scalability of interoperable codes

## MpCCI – a tool for code interoperability

- Emerged from an EU project – public domain OPEN SOURCE tools
- [www.scai.fraunhofer.de/mpcci.0.html](http://www.scai.fraunhofer.de/mpcci.0.html)
- A number of MpCCI facilitated code couplings:
  - ABAQUS + FLUENT for DFSI
  - STAR-CD + NASTRAN for DFSI
- MpCCI here to stay and facilitates genuine coupling – initial experiences not trouble free, but . .

# Sector Specific 'multi-physics' Software

- **Castings**
  - PROCAST <http://www.ues-software.com>
  - MAGMASOFT <http://www.magmasoft.com>
- **Forming**
  - DEFORM <http://www.deform.com>
  - SUPERFORGE <http://www.mscsoftware.com>
  - FORGE3 <http://www.transvalor.com>
- **Polymers**
  - C-Mold <http://www.moldflow.com>
- **Joining Processes**
  - SYSWELD <http://www.esi-group.com>
- **Electronic cooling**
  - Flotherm <http://www.flomerics.com>

## Commercial CAE analysis - a web survey

### Tools claiming multi-physics capabilities:

- **ANSYS/Multi-physics** <http://www.ansys.com>
- **ABAQUS** <http://www.abaqus.com>
- **ADINA** <http://www.adina.com>
- **ALGOR** <http://www.algor.com>
- **AUTODYN** <http://centurydynamics.com>
- **CFD-ACE** <http://www.esi-group.com>
- **DYNA** <http://www.lsc.com>
- **COMSOL** <http://www.comsol.com/>
- **LMS software** <http://www.lms.com>
- **MSC- NASTRAN** <http://www.mscsoftware.com>
- **PHYSICA+** <http://www.physica.co.uk>
- **STAR-CCM+** <http://www.adapco.com>

# Alternative approach: Single Software Framework

- **Key route to closely coupled multi-disciplinary (multi-physics) simulation**
- **Basic requirements of a SSF:**
  - **consistency** of mesh for all phenomena
  - **compatibility** in the solution approaches to each of the phenomena
  - **single database & memory map** so that no data transfer & efficient memory use between programs
  - facility to enable **accurate exchange** of boundary or volume sources (e.g. body force)
  - enables **scalable parallel operation** for all physics interactions

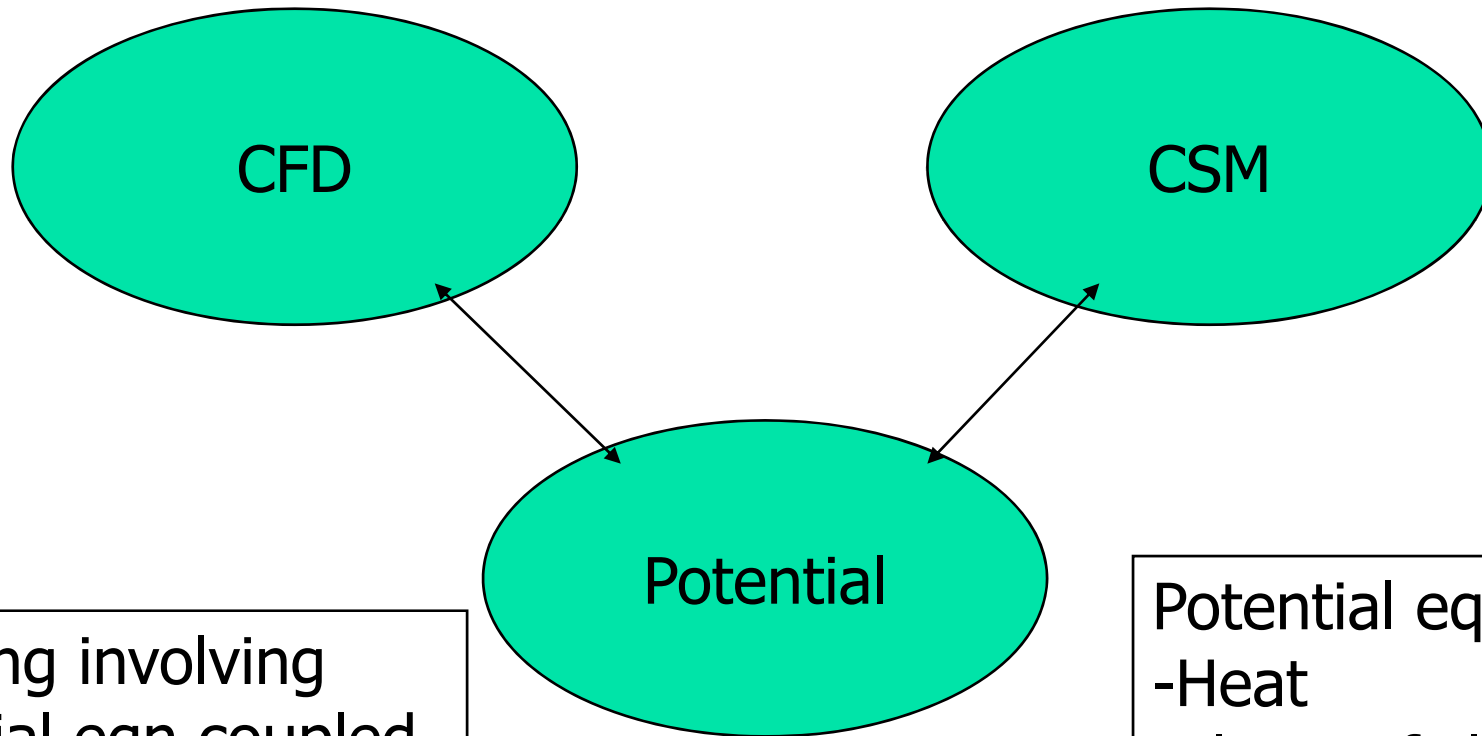

# Single software frameworks for multi-physics

- COMSOL
  - FE solver technology with some phenomena specific modules
  - Nice environment; easy to use
- STAR-CD (& STAR-CCM+ emerging)
  - FV solver technology, polyhedral element
  - CFD based with strong meshing
- PHYSICA
  - Mixed FV (for flow, etc) & FV or FE (for stress)

# 'Straightforward' multi-physics

Anything involving  
Potential eqn coupled  
To some other physics

Potential eqn:  
-Heat  
-Electric field  
-etc

# Helium laser cooling system

Model: LASER  
Analysis: PHYSICA

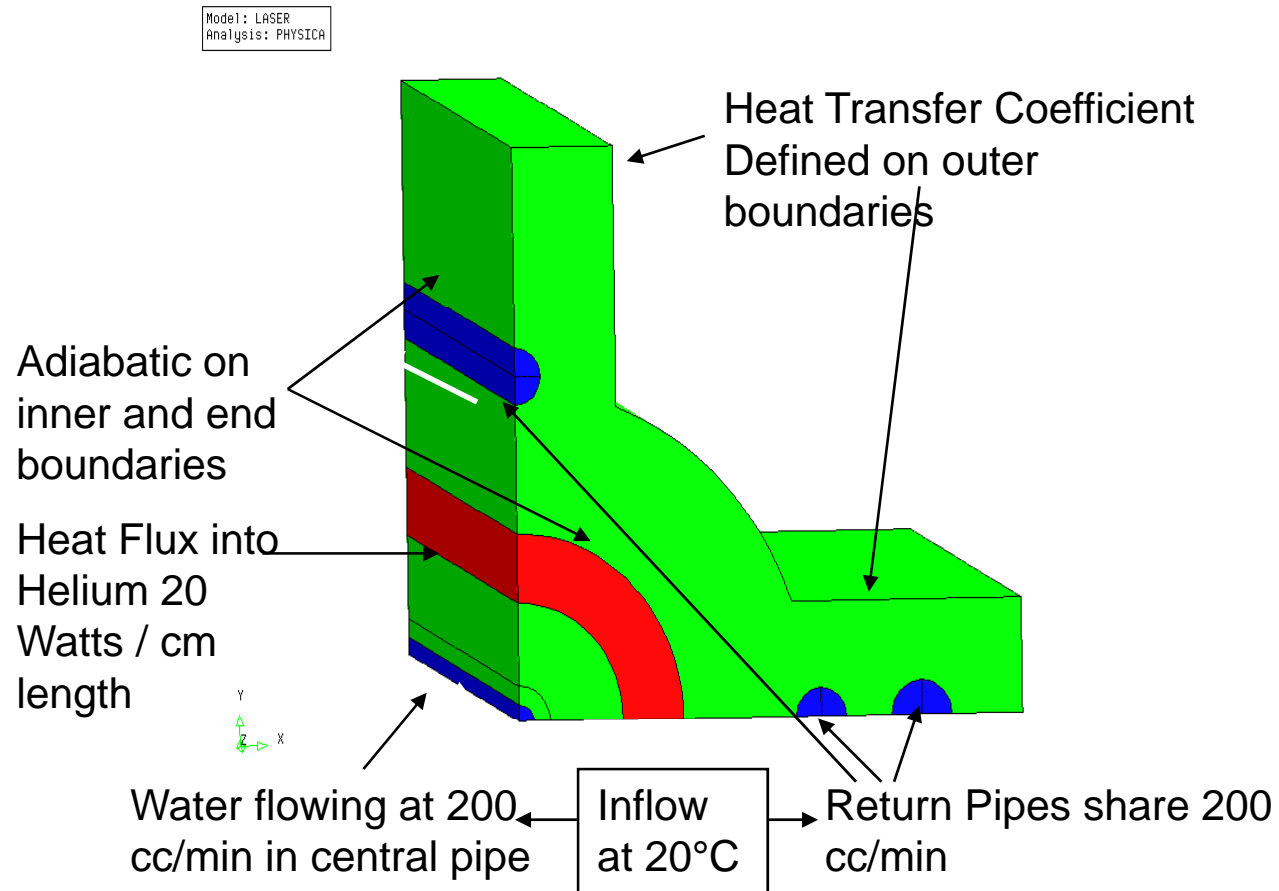

## Physics:

- Heat generation through electrical discharge
- Heat conduction through cooling system
- Flow through cooling pipes
- All coupled

# Boundary Conditions

# Temperature Profiles

Definitely multi-physics

BUT

straightforward

```
Model: LASER
CASE1: PHYSICA Results
Step: 1 TIME: .1E21
Nodal TM
Max/Min on model set:
Max = 194 Min = 20
```

# Multi-physics Modelling

- Physics Requirements

- Fluid Flow
- Heat transfer
- Solidification/phase change
- Stress
- Electro-magnetics
- Acoustics

**MULTI-PHYSICS**

- Geometry

- Complex

**UNSTRUCTURED**

- Large simulations

**PARALLEL**

**Key issue: CFD capability**

# Continuous casting process: example of CFD based multi-physics

- Mixture of liquid steel and argon injected into rectangular mould
- Liquid metal flux sits on top of mould
- Water cooled mould extracts energy forming a solid steel shell
- Continuous withdrawal

Schematic of continuous casting tundish, SEN, and mold

*B.G. Thomas*

MODEL: IRSID

FEMGV 6.1-02 : University of Greenwich 4-JUL-2001 12:26 mesh\_in2.tif

MODEL: IRSID

# Free surface (SEA)

- Solves:

$$\frac{\partial \phi}{\partial t} + \mathbf{u} \cdot \nabla \phi = 0$$

- where  $\phi$  is the fraction of metal in a cell

- van Leer scheme used to reduce smearing of interface
- continuity equation solved for volume not mass
- properties a linear combination of phases present

# Solidification Strand

# Clustering of argon bubbles

# Electromagnetic brake simulations

Computations were also performed to estimate the effects of EMB on the free surface . For this the Maxwell equations were solved, which with the usual MHD assumptions, lead to:

**Continuity of magnetic flux:**  $\nabla \cdot \underline{B} = 0$

**Ohm's Law for conducting metals**  $\underline{J} = \sigma(\underline{E} + \underline{U} \times \underline{B}),$  where  $\underline{E} = -\nabla \phi$

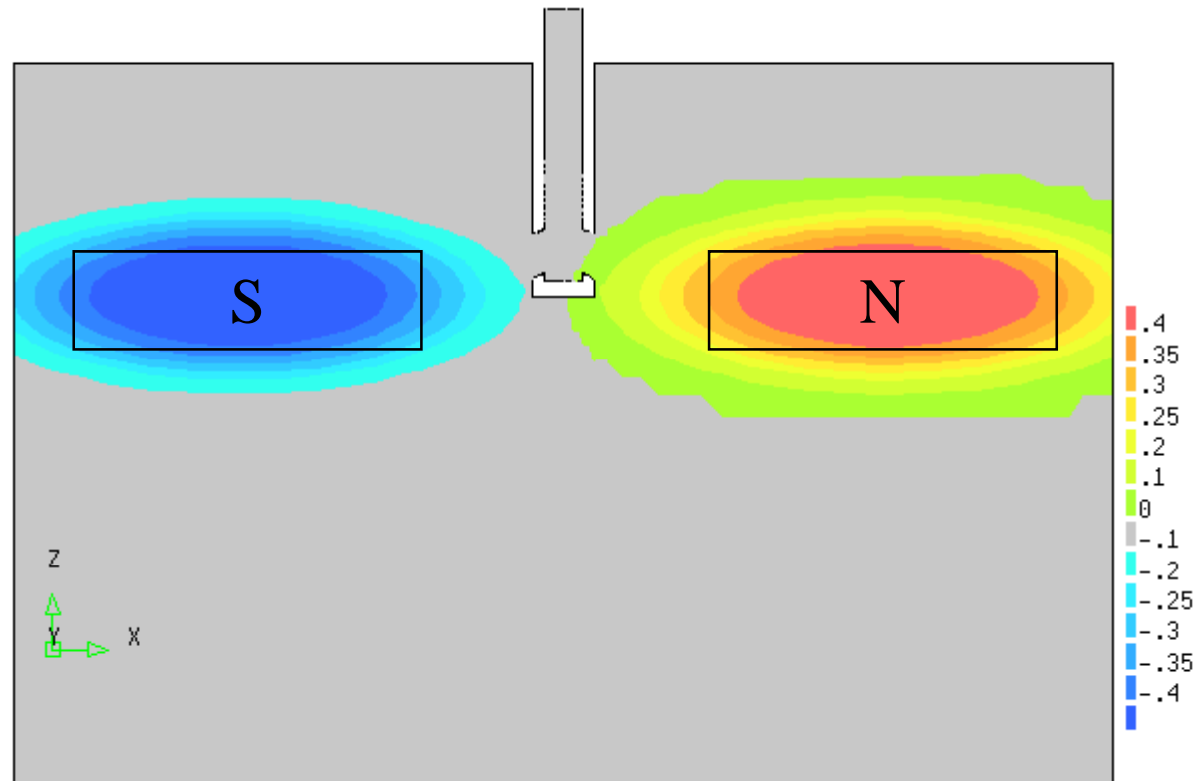

**Magnetic Transport, or Induction equation**  $\frac{\partial \underline{B}}{\partial t} = \nabla \times (\underline{U} \times \underline{B}) + \eta \nabla^2 \underline{B}$  where,  $\eta = \frac{1}{\sigma \mu_m}$

**Lorentz force:**  $F_L = J \times B$

**Note:** Terms containing the velocity  $\underline{U}$ , are only important when  $R_m (=LU/\eta) > 1$

# Brake arrangement

Two electromagnets of opposite polarity ( $B_y = \pm 0.4\text{T}$ ) placed in the jet region to reduce velocity and hence, surface deformation

# Fluid behaviour under EMB conditions

Flow suppressed here

B=0.4T

B=0T

# Coupled EM-flow calculations

- For most practical calculations in metals processing:
- The EM field influences the flow and thermal fields
  - BUT the thermo-fluid phenomena has little influence of the EM fields
  - Hence, essentially one way coupling
  - So calculate the EM field and calculate the thermal and flow loads in the CFD calculation
  - Can implement above model in any good CFD code!

# Welding processes simulation - natural multi-physics

---

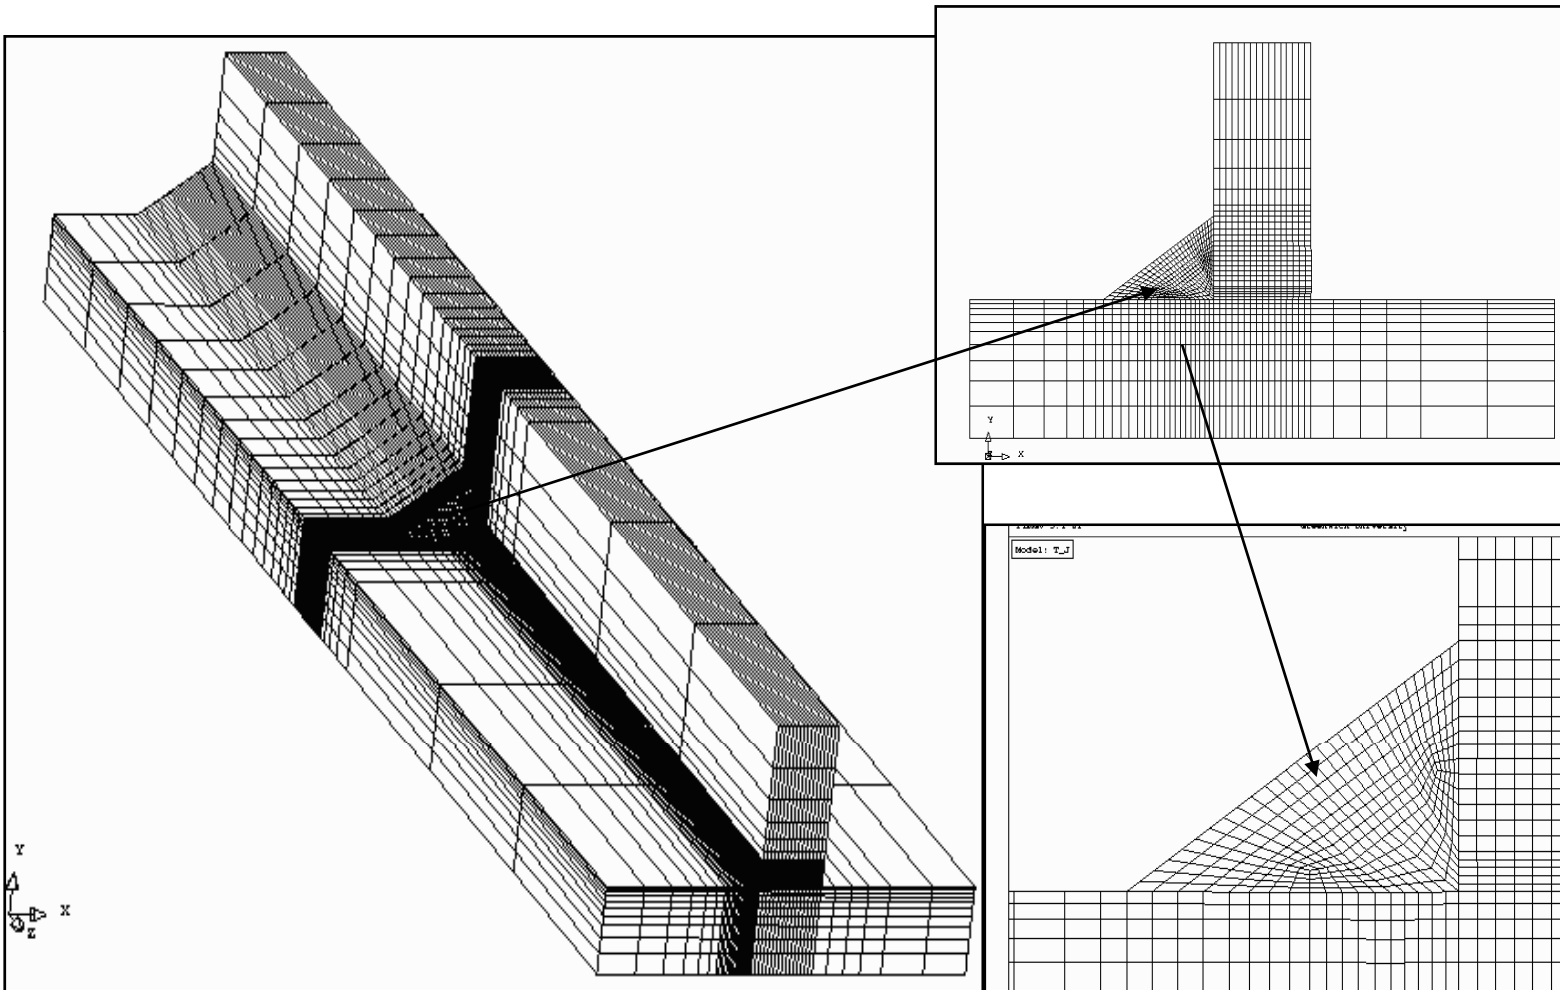

- Processes involve:
  - free surface flow
  - electromagnetic forces
  - heat transfer with solidification/melting
  - development of non-linear stress
- Ideal candidate for multi-physics modelling

# T-Junction arc weld simulation

highlighting HAZ region

# Distortion of T-junction due to heat source

Heat source

# Weld pool dynamics

**Velocity vectors in crosssection**

**Lorentz force distribution in the weld-pool**

# Distortion of T-junction due to heat source

NAFEMS Webinar  
June 2007

# Welding – multi-physics BUT . . .

- Welding involves:
  - free surface fluid flow
  - heat transfer and solidification/melting
  - electro-magnetic fields
  - non-linear stress

BUT . . . no coupling back:

- from thermo-fluids to EM field
- from stress calculation to thermo-fluids

SO . . . reasonably loosely coupled

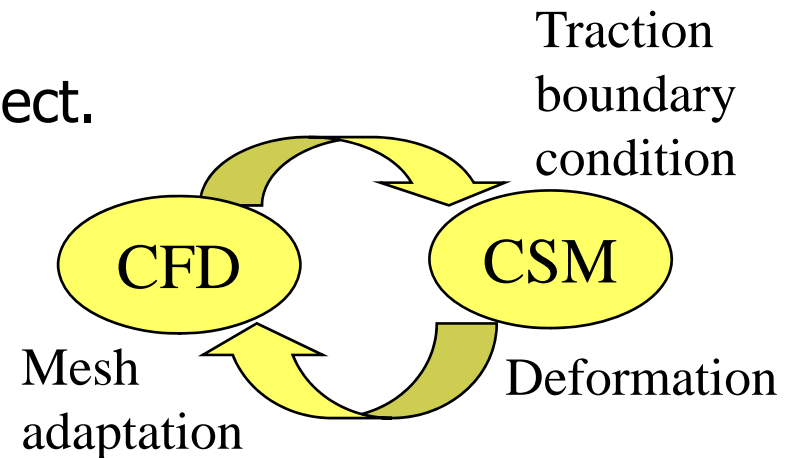

# Generic Dynamic Fluid Structure Interaction

- Closely coupled multi-disciplinary problem

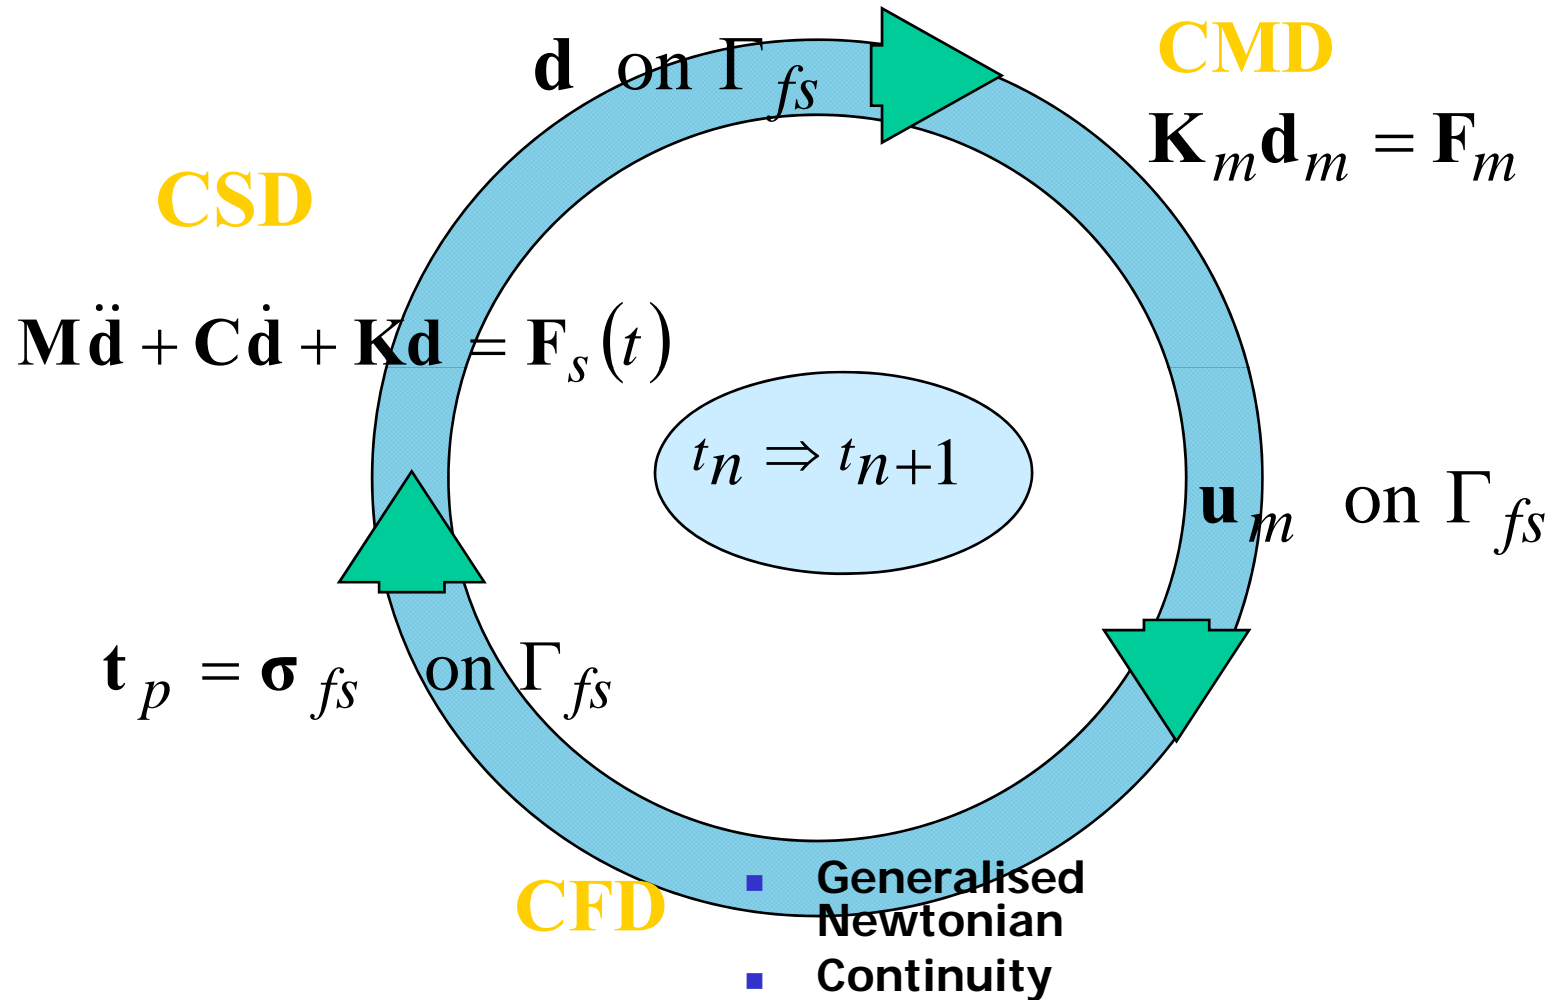

- Time & space accurate
- Very challenging in every respect.
- Issue of GCL

- Implementation of boundary conditions.
- Features of single software framework:
  - Consistency of mesh.
  - Single database & memory map.
  - Compatibility in the solution approaches FV-UM.

# Three Phase Approach

# PHYSICA: Spatial Discretisation for closely coupled multi-physics

- Unstructured mesh

- CFD

- Cell centred
- Or mixed CC- VB
- FV

- CSM

- Vertex based
- FV/FE

# Dynamic fluid-structure interaction

- Targeted at problems involving flow induced vibrations
- Use dynamic structural equations and Navier-Stokes flow equations

# Dynamic response of structure without flow

# Fluid Velocity and Pressure Movies

At tip of wing

NAFEMS Webinar  
June 2007

# Bio-medical multi-physics modelling: the heart!

- Heart – a multi-physics system, featuring interactions between:
  - electro-chemical system
  - fluid
  - structure

# Geometry

- 2D model
- Right ventricle

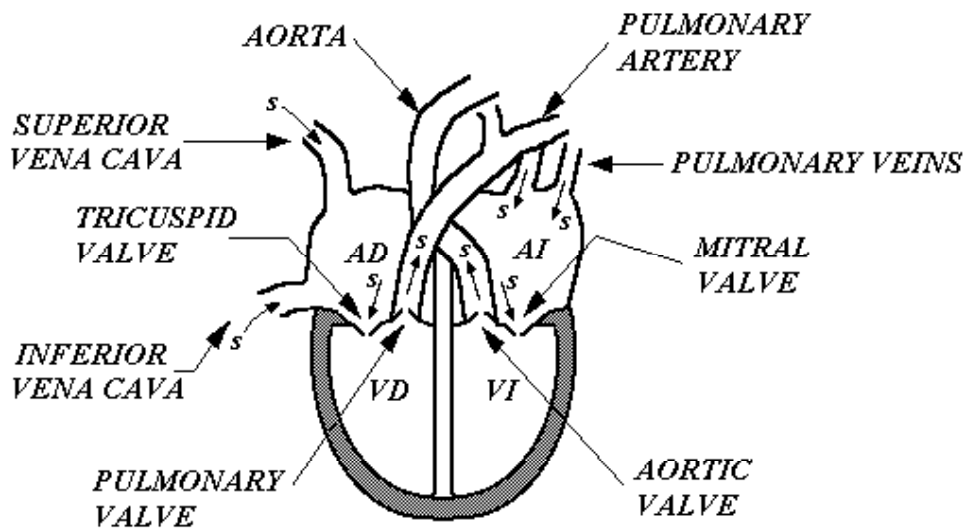

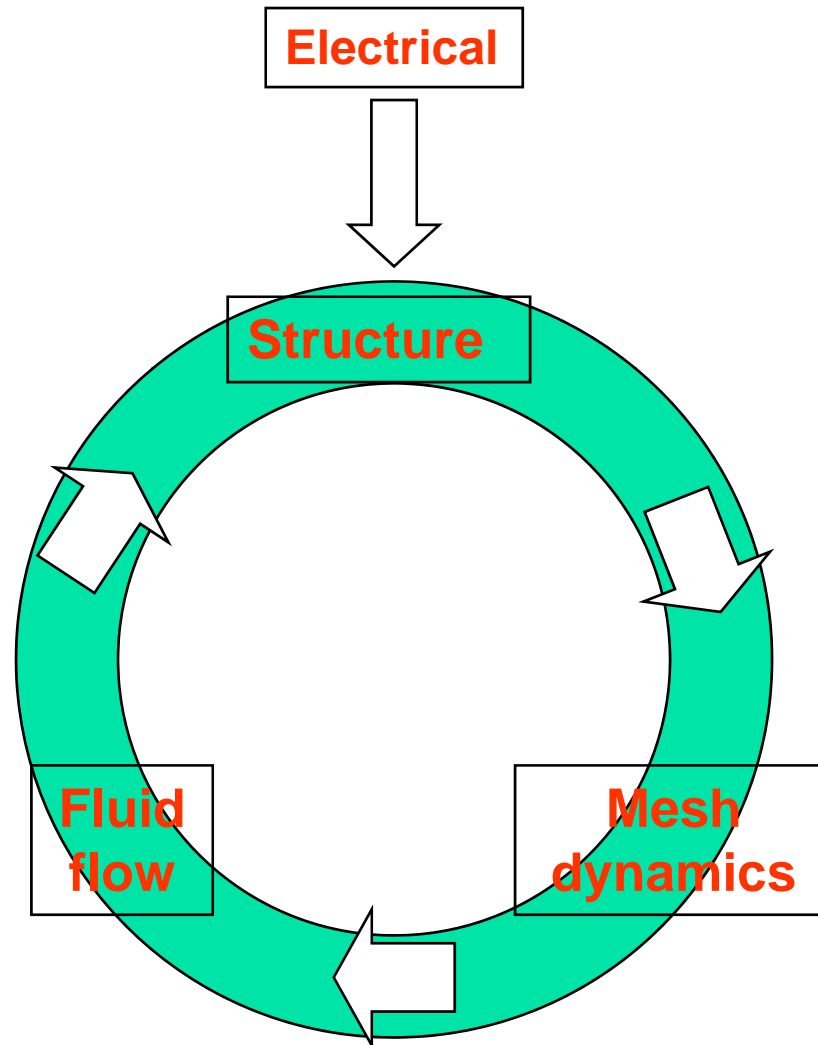

Image from [www.heartvalves.8m.com](http://www.heartvalves.8m.com)

# Electro-fluid-structure interaction

NAFEMS Webinar  
June 2007

# Coupling electrical field to structural mechanics

- Assumption made that small strain model can capture behaviour of heart wall
  - Dominant behaviour of wall is contraction/expansion
  - Shearing effects negligible
- Elastic model
- Change in potential results in a change in tension in the heart wall
- To model tension we introduce an electric strain into structural mechanics equations

# Simulation results

Model: H73  
Deformation = 1  
CASE1: PHYSICA Results  
Step: 1 TIME: 0  
Nodal UPOT  
Max = 0 Min = 0

Model: H73  
Deformation = 1  
CASE1: PHYSICA Results  
Step: 1 TIME: 0  
Invariant VELOCITY RESULTNT  
Max = 0 Min = 0  
Factor = .416E-2

- $\Delta t = 1E-4s$
- 1 structure calc every 10 flow time-steps

- Calculation time  $\approx$  12 hours
- 6K element mesh
- 18 variables per node

# Some health warnings on FSI

- Exchanging data between a CFD code & an FEA code does not amount to anything but loosely coupled FSI (e.g. welding)
- For anything other than coupled FSI:
  - Ask - at what level does the coupling occur?
  - Ask - is the procedure time and space accurate?
  - Ask - what tests have you done to ensure this is the case?
  - Ask – does your code include the GCL in its procedure?

# Parallel Multi-Physics Modelling

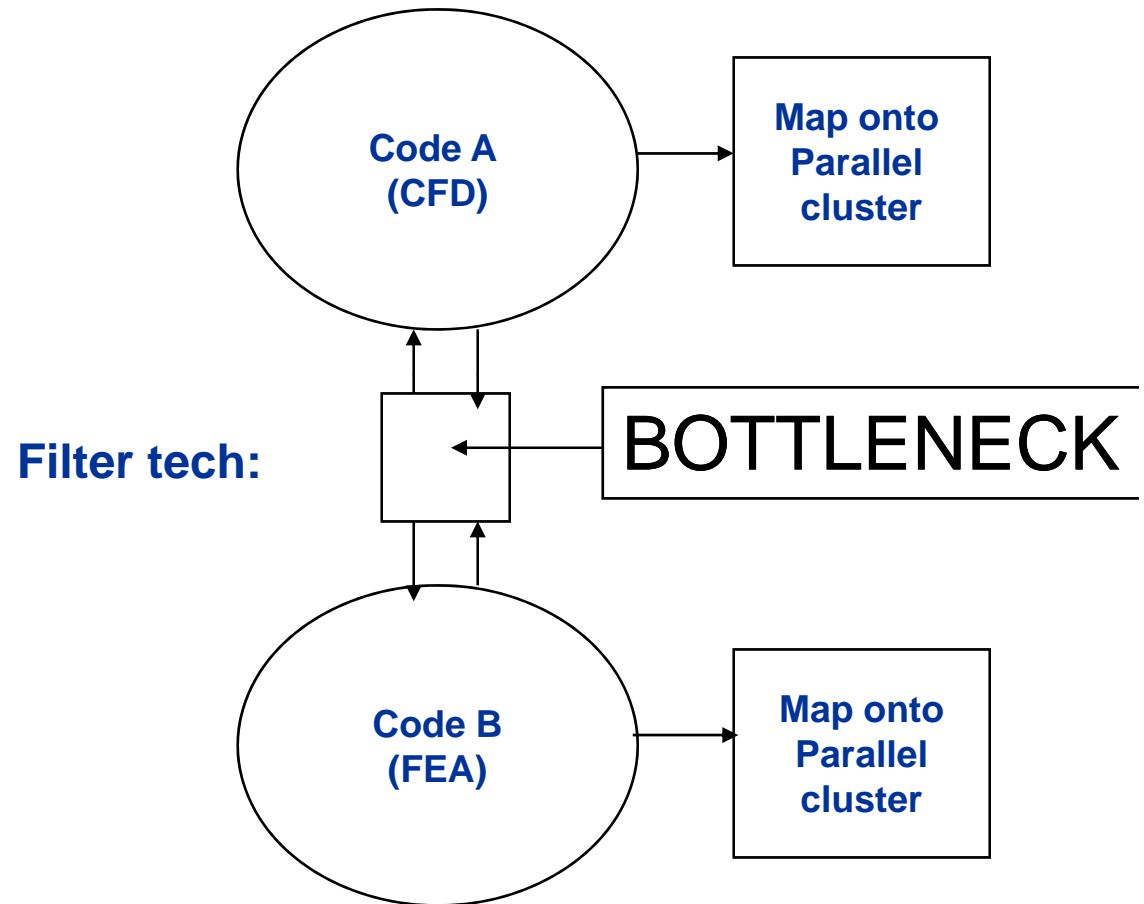

NAFEMS World Congress  
Vancouver, May 2007

# Exploiting parallel cluster technology: the challenge

- MpCCI and other filter technologies
- Upside – enables interaction at the code d'base level
- Downside – all data exchange must go via filter and is a compute bottleneck wrt scalability on parallel clusters

# Parallelisation approach uses mesh partitioning SPMD strategy with non-uniform workload

Partition of 3D unstructured mesh by JOSTLE assuming a homogeneous load balance across the mesh:

- **load balanced** ( even no of cells per node)
- **minimises** sub-domain interface elements
- sub-domain connectivity **matches processor topology** of the parallel system

# Metal Forming - Extrusion

- Involves large scale deformation of metal work-piece through interaction with one or more dies
- Multi-physics problem
  - Flow/deformation of work-piece
  - Heat transfer generated by internal friction
  - Stress/strain in die(s)

EXTRUSION

# Mixed Eulerian-Lagrangian Approach

## Workpiece

- Eulerian mesh
- Free-surface algorithm to track deformation
- Non-Newtonian material model
- Heat transfer plus energy generated by internal friction

## Die

- Lagrangian mesh
- Mechanical behaviour coupled with:
  - Thermal behaviour in workpiece
  - Fluid traction load from workpiece

# Extrusion through U-shaped die

- **Initial diameter = 200mm**
- **Bearing length = 2.5mm**
- **Punch speed = 5.85E-3m/s**

- **Workpiece = 470°C**
- **Die = 450°C**
- **Air = 30°C**

- 63220 elements
- 69507 nodes

# Temperature contours in extruding work-piece

# Effective stress contours and deformation of die

NAFEMS Webinar  
June 2007

# Parallel results

Processors	Run time (hours)	Speed-up
1	81.9	1
4	18.3	4.48
8	10.2	8.03
12	7.5	10.92
16	6.1	13.43

Single phase mesh partitions on 16 processors

- Itanium IA 64 cluster running Linux OS
- Eight nodes, two 733MHz processors per node
- Each node with 2 Gb memory & 2Gb swap space

# Conclusion

- Multi-physics simulation is emerging in a commercially supported manner
- Most successful multi-physics is based upon loose or one-way coupling – even then, ‘heroic computing’
- Close coupling in time and space another ball game - Key here are procedures for time & space accurate simulations; DFSI a key exemplar
- Multi-physics essentially compute intensive – leads to challenge of parallel scalability for multi-physics simulation tools
- Can do for bespoke single software solutions, but for multi-code components, not so clear!
- Challenges for the future – integrating components using essentially distinctive model paradigms & solver strategies
